

AI Shopping Assistant

the deal-hunter agent that stalks the price so you don't

“I want these sneakers under €80” — and that's the last thing you have to do.

You name the thing and the ceiling

the agent watches every shop, every day — and strikes when the true price breaks

“These sneakers, size 43, under €80 delivered.”

From then on the agent owns the hunt:

- tracks the item across shops and borders
- computes landed cost — sticker + delivery + FX + duties + coupons
- filters bait listings and fake discounts
- sends one alert that matters, checkout prepped
- **with a standing mandate — it just buys, within your cap**

DEAL HUNTER

LIVE STRIKE

Nike Dunk Low · size 43 — target €80 delivered

✓ **€76.40 landed**

BUY WINDOW

NL shop: €69 + €7.40 shipping, no FX. Sat at €95 for three weeks; now 11% under the 90-day low. Two left in 43.

Checkout prepped — one tap. Within your standing mandate? Already bought.

✗ **Held:** UK listing at “£59” — €81.60 after FX, delivery and duties. Sticker prices lie; landed cost doesn't.

Why now

the gap no product captures — and the rails that just landed

Prices became weather

Dynamic pricing, flash drops, cross-border shops, coupon churn. The “right price” exists for hours, not weeks — nobody has time to catch it.

Trackers are dumb

Today's tools watch one shop's sticker price and spam you into muting them. None do the arithmetic that decides value: delivery, FX, duties, fake “was €120” anchors.

Agentic commerce is landing

Agent checkout APIs and delegated payment mandates are arriving right now. For the first time an agent can not only find the deal — it can close it.

How it lives in your day

from one sentence to a completed purchase

1

You state the want

one plain-language message

Item, size, ceiling, taste. No filters, no saved searches. Change it anytime.

2

The agent stalks

monitor · match · recompute

Tracks shops and marketplaces, matches the same product across messy titles, recomputes landed cost as prices and FX move.

3

The price breaks

verify before celebrating

Real seller, real stock, real discount — not a bait listing or an inflated “was” price.

4

Strike — or buy

one alert · checkout prepped

One tap to buy. With a standing mandate and a cap, the agent completes the purchase itself and logs why.

Your brief, plain English

and the mandate — when may an agent spend your money?

“

Nike Dunk Low, 43, under €80 delivered. New only, no resellers. If it lands within €5 of target and stock is low — don't ask, just buy. Anything else, ping me once.

STANDING CONSENT

You grant it once, in the brief.
Scoped to an item, a cap,
conditions. Revocable anytime.

HARD CAPS

The mandate is a ceiling the
agent cannot reason around.
Borderline → escalate to human.

RECEIPTS + WHY

Every strike logs the full
reasoning and the math.
Your overrides sharpen the brief.

Escalate everything = useless · decide everything = scary. The calibrated line is the subtle art.

What you'll have to crack

scope ruthlessly — the judgment is the project

Mock the merchants, real the math

Live scraping is a demo hostage. Build a deterministic price-event simulator; the judgment and the landed-cost engine are the project.

The same-product problem

Matching one sneaker across fuzzy titles, SKUs and fakes is the hard core. Decide what to solve vs. seed.

Landed cost, not sticker

Delivery + FX + duties + coupon validity — the arithmetic where every existing tracker dies.

One alert that matters

Alert everything = muted; alert never = useless. Calibration against the user's ceiling is the subtle art.

The mandate line

When may an agent spend money unattended? Caps, standing consent, precedent, receipts. Where good teams win.

Proving it works

Eval set with bait listings, fake discounts and FX traps. Report strike precision and false-buy rate.

WHY PICK THIS CASE

Agentic commerce, on a leash.

Your intent. Your cap. Its patience.

A weekend-sized slice of the biggest question in agent payments: when is an agent trusted to spend real money — and how do you prove it earned that trust?

Demo-friendly · measurable · no PSP integration required · real agentic-commerce endgame
